Modular steps up

MODULAR Mining Systems has unveiled the third generation of its MineCare maintenance management solution.

Andrew Snelling | 17 Dec 2015 | 16:11 | News |

Modular Mining has released the third version of its MineCare solution.

The real-time fleet health monitoring solution was first put on the market in 2003, with the latest incarnation sporting a range of additional features.

Cloud-based deployment simplifies installation, upgrades, and management, allowing Modular to offer MineCare 3 through a data-as-a-service program.

This also eliminates IT infrastructure investment capital costs for users and allow for a high degree of scalability so the system can be applied to small and large fleets.

Other software features include a geographic map view for heightened mine visibility in real time, intelligent data collection, monitoring, and analytics capabilities, real-time visual equipment health tracking, component-level problem detection and alarms, multi-equipment trending to predict potential failures and assist in proactive planning and streamlined and user-configurable dashboards for at-a-glance information.

Users are able to use the tailored dashboards to perform predictive trending for early detection of abnormal equipment behaviour, rates of change and parameters outside of normal operating ranges.

“It’s an ideal solution for any sized organisation,” Modular vice-president product innovation Michael Lewis said.

“Small mines to entire corporations can manage the health of all of their assets from anywhere in the world.”

The MineCare 3 solution can deploy as a standalone application or it can integrate with Modular’s Dispatch fleet management system.
